Project DUE BY: 3/13/2026 @ 11:59pm

Identifying the Problem

Introduction

You will complete a technical research project that will involve the preparation of a security policy, adoption of a best practice and the development of a procedure. Your job is to create and document a single technical operation. You do not need to have technical hands-on experience, just the ability to review material and come up with a cohesive plan to solve the problem.

Step 1: Select one of the following policy areas and problems to solve:

1. Comprehensive identity management - Password resets (self-service and service desk assisted)
2. Data management - Managing backups of critical databases (should include encryption at rest and retention)
3. Network Access - Acceptable use policy
4. Remote access - Required MFA for VPN access

Step 2: Research the problem you need to solve

Step 3: Establish the scope for what is included in your policy (groups of users, systems, types of data, software required, etc.)

Step 4: Select at least one published standard, guideline and/or best practice for accomplishing the task.

Step 5: Write the procedure using a step-by-step format

Step 6: Identify at least one method for validating that the policy is followed

I do not expect this to be a completely original work, unlike your research paper. There are certainly many examples of not only actual procedures, but also templates that may help you along the way. Please ensure that you give credit for templates and other utilized material. It will not affect your grade if you use someone else's work as a base, but I expect you do enhance and add value.

If you need guidance help understanding some of the technical pitfalls you are being asked to explore, please feel free to contact me. The length of the document is not as critical to me as the thought process that goes into solving the problem identified.

You must get authorization from me before submission once you have completed Steps 1-3 and optionally Step 4. Use this [link](#) to submit your progress and ensure that your selected focus is acceptable.

Grading as follows:

- 25pts – Policy Area Selection and demonstrated understanding of the problem
- 25pts – Definition of in-scope items
- 25pts – Standard/guideline/best-practice selection
- 25pts – Procedure
- 25pts – Validation
- TOTAL - 125pts

You must submit your project via the Sakai assignment tool with a filename as follows 348-LASTNAME.xxx (where LASTNAME is replaced with your last name and the .xxx is replaced with a word processing file extension).
